Skills: ReactJS, Redux, JavaScript (ES6+), HTML, CSS, JSON, jQuery, jBuilder, JIRA, Figma, Sketch, Agile, AWS, Ruby on Rails, SQL, PostgreSQL, MongoDB, Node.js, Express, TDD, Postman, Git, REST API development & integration

Experience

Coding Expertise for AI Training, Outlier (Freelance) | December 2024 - Present

- Collaborate remotely to improve generative AI large language models (LLMs) by providing expert feedback and guidance on coding-related tasks
- Apply scientific reasoning and domain knowledge to evaluate, debug, and improve AI-generated outputs, ensuring logical consistency and accuracy across complex tasks
- Craft and refine coding problems and solutions to train AI models, enhancing their ability to tackle complex programming challenges and deliver high-quality code outputs
- Reviewed and edited AI-generated technical content for accuracy and clarity, ensuring adherence to LaTeX formatting guidelines

Backend Software Engineer, Carboncopies Foundation (Volunteer) | November 2022 - Present [live site](#) | [gitlab](#)

- Teamed up with a Product Manager and Frontend Engineer to devise a programmatic approach for optimizing team collaboration at Carboncopies, employing graph-based visualization to depict successive milestones
- Developed custom REST APIs for exporting and importing data, bypassing AuraDB's cloud feature to enable local database merges for debugging and performance improvements, reducing costs by up to \$146/month
- Implemented Google OAuth2 with validation logic to restrict access, allowing only Carboncopies members to log in and perform create, update, and delete functions, ensuring secure and controlled platform usage
- Created extensive documentation outlining backend server configuration and effective utilization of API routes, including detailed instructions and illustrative code snippets to enhance system utilization

Frontend Software Engineer, TBD Health | October 2020 - February 2021

- Collaborated with founders, CTO, and clinicians to implement an iterative approach to enhance UI by modularizing components with React Hooks, performance tests, developing MVPs and product features, and debugging in a test production environment to meet the deadline for patient tests and create a responsive UI
- Engineered a HIPAA-compliant messaging feature enabling secure communication between patients and clinicians, facilitating appointment scheduling, reply chaining, and managing server-generated messages
- Modularized React front-end components for Clinician and Patient web applications, slashing Messaging feature development time by 50%, while ensuring cross-platform brand consistency and enhancing UX
- Participated in daily standups to provide updates, demo features, end-to-end testing of the patient-clinician workflow, bug fixes, and roadblocks, and engaged with the team to ensure effective communication and project alignment

Personal Projects

SuperTramp

[live site](#) | [github](#)

React, Redux, Ruby on Rails 7, HTML, CSS, PostgreSQL, AJAX, AWS, Heroku

Tribute to the popular camping website HipCamp, where users explore available listings across the world

- Implement Ruby on Rails backend to connect with AWS S3 for listing and avatar image cloud storage, to increase application scalability
- Identify real-world locations with Google Places Autocomplete API, which allows users to search for campsites based on reliable geospatial data
- Constructed validation logic that checks new bookings against existing bookings to block double bookings and ensure the best user experience

Education

University of California, Davis | Bachelor of Science in Microbiology
